

ROOT ACCOUNT ADMINISTRATION · VERSION 2.0

Super Administrator Manual

First-run setup, Admin-account management, password recovery, and protection of the system's sole Super Admin account.

EGAS Employee Clearance System

Verified against the application and source code

16 August 2026

Purpose and authority

The single Super Admin creates and maintains Admin accounts. It cannot manage operational users or clearance requests, and no account—including itself—can reset or delete the Super Admin.

1. First-run setup and sign-in	Bootstrap
2. Create Admin accounts	Daily task
3. Reset or delete Admin accounts	Maintenance
4. Lockout prevention and reference	Critical control

Sole-account warning: there is exactly one Super Admin. The application has no self-service recovery path for it. Protect its credentials and establish an EGAS-approved recovery procedure before production use.

1. First-run setup and sign-in

Brand-new installation

When the database contains zero users, the login page redirects to the one-time setup screen. This is the only unauthenticated account-creation flow.

- 1 Confirm that this is the intended new installation and that you are using the authorized server address.
- 2 Enter the Super Admin holder's full name, internal landline, work email, password, and confirmation.
- 3 Use at least 12 characters with a symbol and follow any stronger EGAS password requirements.
- 4 Submit once. As soon as any account exists, setup closes permanently and normal login begins.
- 5 Create one or more Admin accounts so operational staffing can be provisioned.

Development reset: `npm run seed:final:reset-users --prefix backend` deliberately deletes every user to reopen setup. It is local/development-only and must never be used on production data.

Normal login screen after first-run setup is complete.

Sign-in security

There is no self-registration or emailed reset link. If a temporary password was issued, the application forces a new permanent password before any other authenticated route can be used.

2. Create Admin accounts

Create account

All accounts

Name	Email	Role	Department	Landline	Status	Actions
حساب المسؤول التجريبي	admin@demo.local	Admin	—	1	Active	Reset password Delete account

Super Admin dashboard. Only Admin accounts appear because that is the Super Admin’s management boundary.

- 1

Enter your current Super Admin password in the confirmation field.
- 2

Enter the new Admin’s full name, internal landline, work email, and a strong temporary password.
- 3

Confirm the role is **Admin**; the interface does not offer operational or Super Admin roles.
- 4

Review the exact email, create the account, and transmit the temporary credential securely.
- 5

The Admin replaces it at first login, then creates File Management and reviewer accounts.

Super Admin can	Super Admin cannot
Create/list/reset/delete Admin accounts	Create another Super Admin
Provide assisted recovery to Admins	Create File Management or reviewer accounts directly
Maintain enough Admin coverage	View or act on clearance requests
Manage Admins only	Reset or delete itself

3. Reset or delete Admin accounts

Reset an Admin password

- 1 Verify the Admin's identity using EGAS policy and match the exact account email.
- 2 Select **Reset password**, enter the Super Admin's current password, and choose a temporary password.
- 3 Transmit it through an approved secure channel. The Admin must replace it on next login.

Delete an Admin account

- 1 Confirm departure/role change, the exact email, authorization, and that sufficient Admin coverage remains.
- 2 Select **Delete**, read the permanent-action warning, and re-enter the Super Admin password.
- 3 Confirm only when permanent account removal is intended.

Do not remove the last practical Admin coverage. Without an Admin, no one can create or maintain Document & Records Management or reviewer accounts until the Super Admin creates a replacement.

Neither action targets the current Super Admin account. This is enforced by the server, not merely hidden in the interface.

4. Lockout prevention and reference

Required operational safeguards

- ☐ Keep the Super Admin email and credential in an EGAS-approved secure credential store.
- ☐ Limit routine use; use Admin accounts for ordinary operational-account administration.
- ☐ Keep contact details accurate so the login-page help flow is useful.
- ☐ Maintain at least two authorized Admin accounts where policy permits.
- ☐ Test the documented organizational recovery process in an isolated environment.
- ☐ Never use the user-reset development command against production.
- ☐ Log out after every Super Admin session and report suspicious access immediately.

Problem	Meaning	Action
Setup page does not open	At least one user already exists.	Use normal login; do not erase users to bypass the guard.
Operational role is unavailable	Super Admin manages Admins only.	Create/use an Admin account for operational users.
Super Admin is not listed	Self-management is intentionally prohibited.	Follow the approved recovery procedure; do not manipulate production ad hoc.
Admin sees "Set new password"	The reset password is temporary.	The Admin must choose a compliant permanent password.
Clearance request is unavailable	Super Admin has no clearance-data permission.	Use the appropriate operational role; do not broaden access.

Verified 16 August 2026. EGAS organizational policy remains authoritative where it adds controls.
